Grow and Bloom nutrients

CELLMAX COCOS

CELLMAX COCOGROW AND COCOBLOOM

The Cellmax Coco nutrient formula consists of two components: an X component and a Y component, which encourage both growth and flowering. The Cellmax coconut nutrient is used during the entire growth and flowering process. It ensures that plants grow rapidly and flower abundantly. Cellmax Coco has been specially developed for use on 100% natural coconut substrates and is made from coconut shell. It is easy to use, gives a high-quality end result and is free from toxic ballast substances. This coconut nutrient works best when combined with Cellmax Coco pro-substrates. **Please note: do not mix components X and Y directly with one another! For the best result, first dissolve one component in water and then the other.**

CELLMAX ROOTBOOSTER

The development of plant roots is very important for the end result of the crop. Cellmax Rootbooster increases resistance and reduces the risk of diseases. When repotting (transplanting) and pruning, the plant's resistance reduces significantly. During these phases, Cellmax Rootbooster maintains the level of resistance and protects the plant, so that growth can continue smoothly. Cellmax Rootbooster is rich in organic trace elements and vitamins and has a vitalising effect on plants. Use Cellmax Rootbooster on young plants in particular and when repotting. This allows the roots to continue developing properly and the plant to continue taking root. With Cellmax Rootbooster, plants stay healthy and strong. Cellmax Rootbooster is administered with rainwater and in the event that few roots develop, it can also be sprayed directly onto the plant. **Result: improves resistance and ensures a strong root system.**

CELLMAX SUPERENZYME

Cellmax Superenzyme is a high-quality enzyme preparation that has been specially developed by Cellmax for decomposing dead organic material around the roots of the plant. Cellmax Superenzyme keeps the substrate clean and ensures that undesirable microorganisms and bacteria are unable to develop, thereby considerably reducing the risk of diseases. Cellmax Superenzyme rectifies the air/water ratio in the substrate and as a result, it is much more suitable for reuse. Cellmax Superenzyme contains more than 16* enzymes and vitamins and natural plant extracts. **Result: improves the absorption of nutrients.**

CELLMAX PK-BOOSTER

Cellmax PK booster is a high-quality phosphor-potassium product that encourages the development of plant fruits during the flowering phase. Adequate phosphor is necessary for fruits to develop properly, and a large quantity of potassium is necessary for transporting nutrients. The main job of potassium is to maintain the cell pressure and cell size of plants. Potassium also affects photosynthesis, the energy that the cells produce and the absorption of carbon dioxide, which is why flowering plants require large quantities in order to survive. Cellmax PK Booster has the purest composition of phosphor and potassium, guaranteeing that nutrients are absorbed quickly. **Result: strong plants that develop more fruit.**

CELLMAX FLOWERSTIMULATOR

Cellmax Flowerstimulator is a bloom booster that has been specially developed by Cellmax for the flowering phase of the plant. It ensures abundant flowering and that the fruits of quick-growing plants are wonderfully sweet in flavour. Cellmax Flowerstimulator contains natural bloom boosters and bloom regulators, which guarantee that the fruits of all plants develop more fully. It improves the absorption of nutrients and encourages photosynthesis; the plant bears more fruit and deals with the available fertilisers more efficiently. **Result: greater yield and more flavour.**
